

VERMICOMPOSTING UNIT

One of the green initiatives of college is vermicomposting unit. It is a system that uses worms to break down organic waste into nutrient- rich compost. It is an eco-friendly way to recycle kitchen scraps and other organic materials, producing valuable fertilizer for plant. Our college has been using this fertilizer in our plants since we built this unit in the year 2022.

A Vermicomposting unit has been set up in the college to produce organic manure and to manage solid waste disposal.
