

PAPER RECYCLE UNIT:

- It is part of the Earn while Learn Programme.

A paper cycle unit is a facility that processes used paper and cardboard to recycle them into new paper products. The process typically involves sorting, cleaning, and breaking down the paper fibres to create pulp, which can then be used to produce recycled paper. This helps reduce the demand for virgin wood pulp, conserves resources, and minimizes environmental impact associated with paper production. All the internal answer sheets, assignments and project and all the other paper waste from various departments have been used to create new papers. The paper files we are using now are a product of our paper recycle unit.
